Question: Consider the probability space (Ω, \mathcal{G}, P) , where $\Omega = \{1, 2, 3, 4\}$, $\mathcal{G} = \{\emptyset, \Omega, \{1\}, \{4\}, \{2, 3\}, \{1, 4\}, \{1, 2, 3\}, \{2, 3, 4\}\}$, $P(\{1\}) = \frac{1}{4}$. Let X be the random variable defined on the above probability space as $X(1) = 1$, $X(2) = X(3) = 2$, $X(4) = 3$. If $P(X \leq 2) = \frac{3}{4}$, then find $P(\{1, 4\})$ (rounded off to two decimal places).
(GATE ST 2023)

Solution:

$$P(\{1, 4\}) = P(X = 1 \text{ or } X = 4) \quad (1)$$

X is defined as

$$X(1) = 1, \quad X(2) = X(3) = 2, \quad X(4) = 3 \quad (2)$$

We can express $P(1,4)$ as:

$$P(\{1, 4\}) = P(X = 1) + P(X = 4) \quad (3)$$

$$P(X \leq 2) = P(X = 1) + P(X = 2) + P(X = 3) \quad (4)$$

Lets denote

$$P(X = 2) = P(X = 3) = p \quad (5)$$

Now we can solve for p

$$\frac{3}{4} = P(X = 1) + 2p \quad (6)$$

$$\frac{3}{4} = \frac{1}{4} + 2p \quad (7)$$

$$p = \frac{1}{4} \quad (8)$$

Now that we have p , we can find $P(X=4)$

$$P(X = 4) = p = \frac{1}{4} \quad (9)$$

Finally

$$P(\{1, 4\}) = P(X = 1) + P(X = 4) = \frac{1}{4} + \frac{1}{4} = \frac{2}{4} = \frac{1}{2} \quad (10)$$

$$P(\{1, 4\}) = 0.5 \quad (11)$$
